Hi!
I’m Teo!

Reinforcement Learning Workshop

Discovery

What will we do today

1. **Presentation** (30 minute)
2. **Discussions and Questions** (10 minute)
3. **Code presentation** (5 minute)
4. **Walk through code**

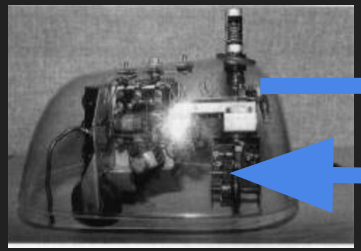
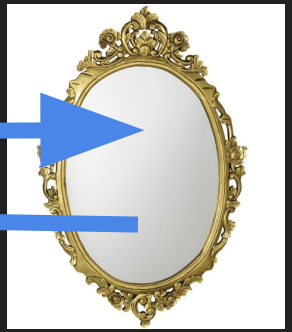
Elmer and Elsie (1948)

- 2 electronic robots built from extra war materials and clockwork mechanisms, programmed to think.
- A light sensor.
- Programmed to avoid external obstacles using the sensors they were equipped with.

In one of the experiments, a light was placed on Elmer's shell, at which point the robot began to move erratically. The scientists saw this as a kind of enthusiasm.





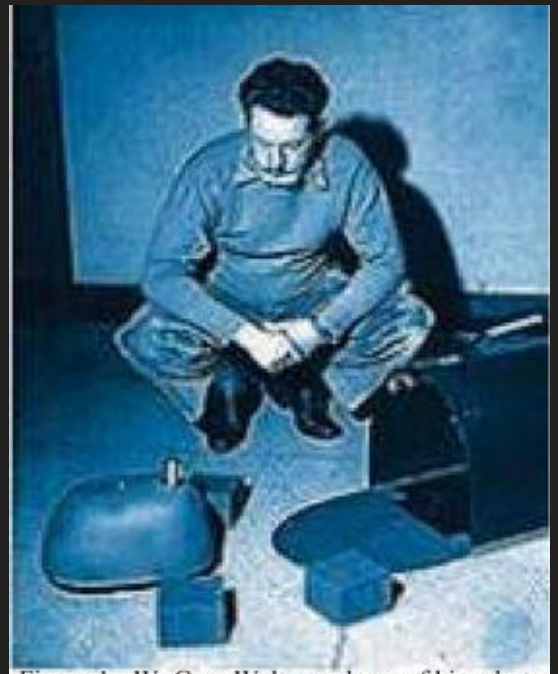


Figure 1 - W. Grey Walter and one of his robots

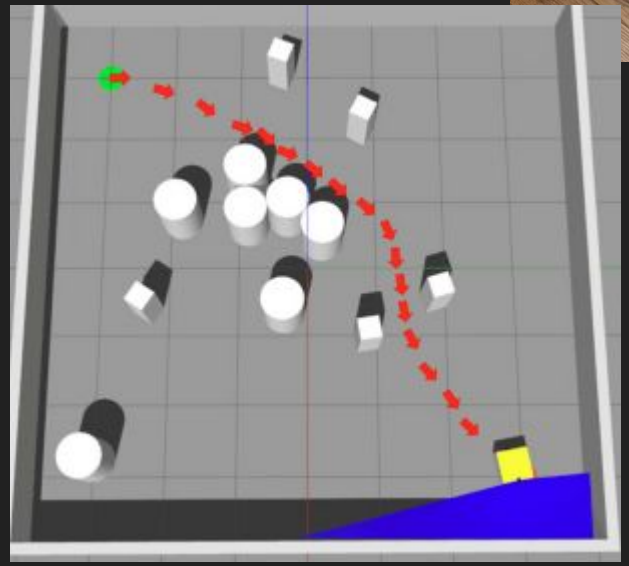
Hoover Robots (2010-)



Deep Blue vs. Kasparov (1996- 1997)

Deep Blue was a supercomputer built by IBM to play chess.

The 1996 match

Game #	White	Black	Result	Method of conclusion
1	**Deep Blue**	Kasparov	1–0	Resignation
2	**Kasparov**	Deep Blue	1–0	Resignation
3	Deep Blue	Kasparov	½–½	Draw by mutual agreement
4	Kasparov	Deep Blue	½–½	Draw by mutual agreement
5	Deep Blue	**Kasparov**	0–1	Resignation
6	**Kasparov**	Deep Blue	1–0	Resignation
Result: **Kasparov–Deep Blue: 4–2**				

The 1997 rematch

Game #	White	Black	Result	Method of conclusion
1	**Kasparov**	Deep Blue	1–0	Resignation
2	**Deep Blue**	Kasparov	1–0	Resignation
3	Kasparov	Deep Blue	½–½	Draw by mutual agreement
4	Deep Blue	Kasparov	½–½	Draw by mutual agreement
5	Kasparov	Deep Blue	½–½	Draw by mutual agreement
6	**Deep Blue**	Kasparov	1–0	Resignation
Result: **Deep Blue–Kasparov: 3½–2½**				

Deep Blue
IBM chess computer

Garry Kasparov
World Chess Champion

Deep Blue vs. Kasparov (1996- 1997)

Deep Blue a fost un super-computer construit de IBM să joace șah.

The 1996 match

Game #	White	Black	Result	Method of conclusion
1	**Deep Blue**	Kasparov	1–0	Resignation
2	**Kasparov**	Deep Blue	1–0	Resignation
3	Deep Blue	Kasparov	½–½	Draw by mutual agreement
4	Kasparov	Deep Blue	½–½	Draw by mutual agreement
5	Deep Blue	**Kasparov**	0–1	Resignation
6	**Kasparov**	Deep Blue	1–0	Resignation
Result: **Kasparov–Deep Blue: 4–2**				

The 1997 rematch

Game #	White	Black	Result	Method of conclusion
1	**Kasparov**	Deep Blue	1–0	Resignation
2	**Deep Blue**	Kasparov	1–0	Resignation
3	Kasparov	Deep Blue	½–½	Draw by mutual agreement
4	Deep Blue	Kasparov	½–½	Draw by mutual agreement
5	Kasparov	Deep Blue	½–½	Draw by mutual agreement
6	**Deep Blue**	Kasparov	1–0	Resignation
Result: **Deep Blue–Kasparov: 3½–2½**				

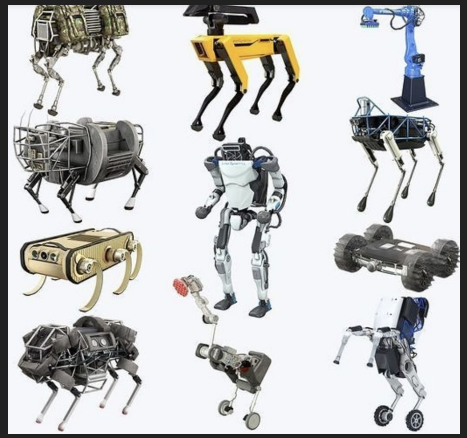
Deep Blue
IBM chess computer

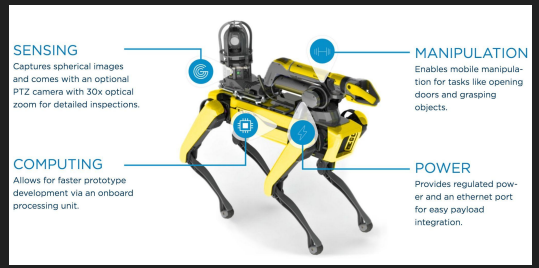
Garry Kasparov
World Chess Champion

În al doilea și ultimul joc intr-o pozitie de final, Deep Blue a ales o mișcări “atipice” unui calculator după spusele campionului, care nu urmăreau un **castig concret**. Codul care guverna mișcările lui Deep Blue a fost sters iar computerul ars.

Boston Dynamics Robots (1992- 2024)

- Extremely agile, they navigate diverse terrains and adapt to obstacles.
- Used in industry for inspections, surveillance, and transport, demonstrating real-world applications of AI and reinforcement learning.
- They open doors and climb stairs, performing complex tasks and transforming interactions with the environment.





MuJoCo - DeepMind (2012)

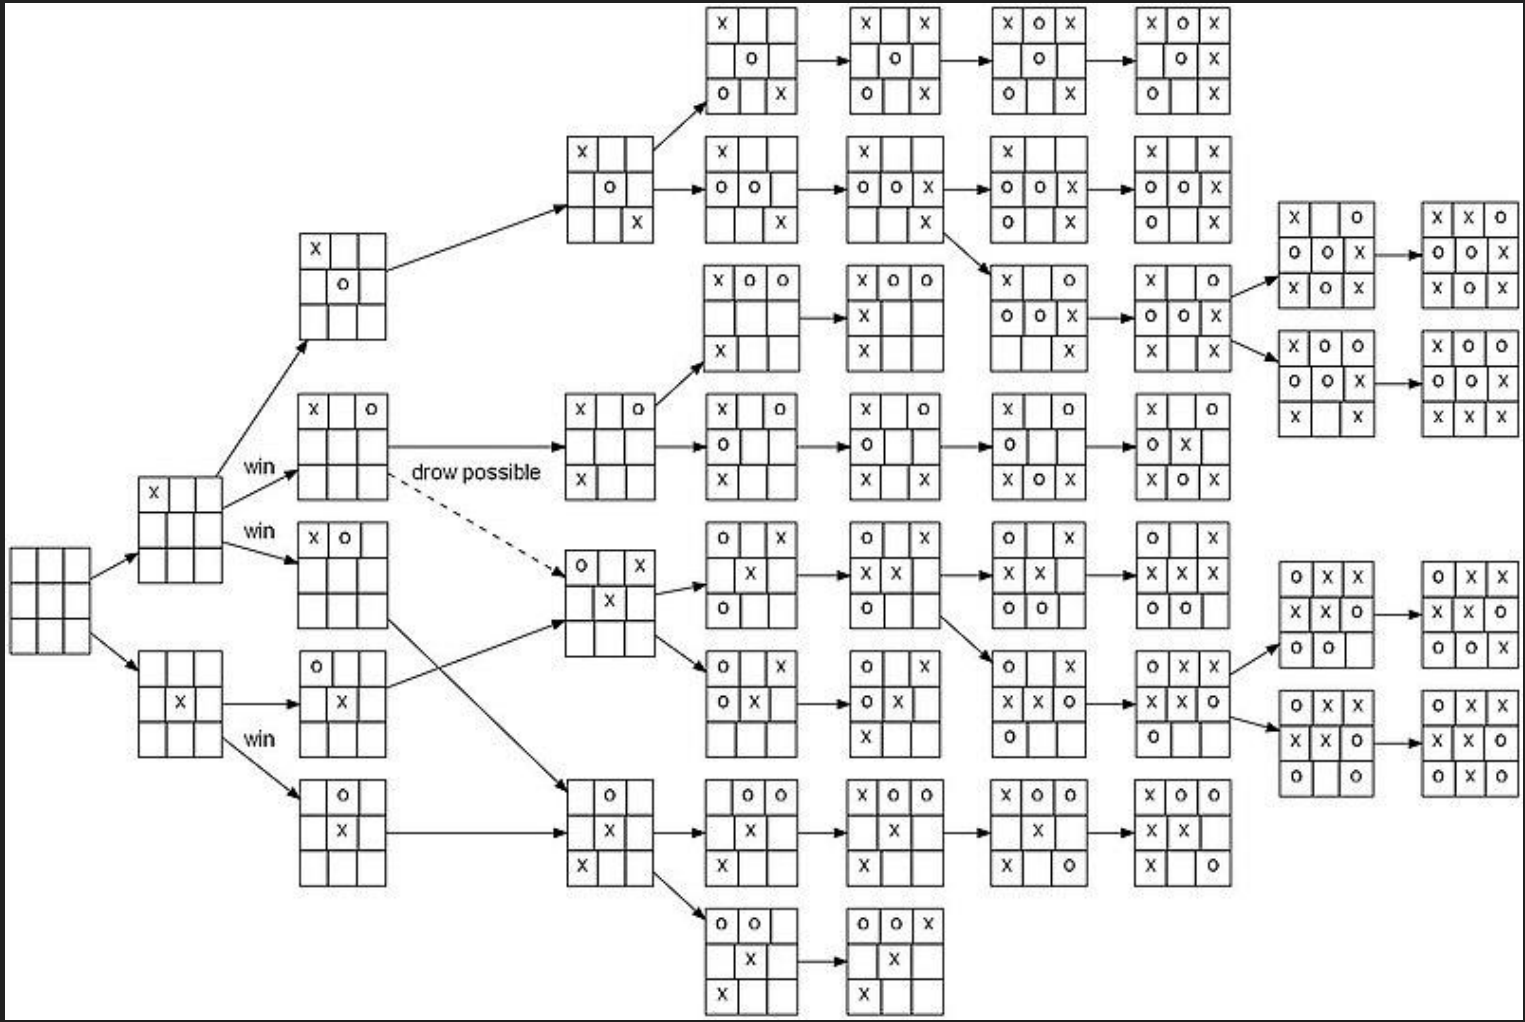
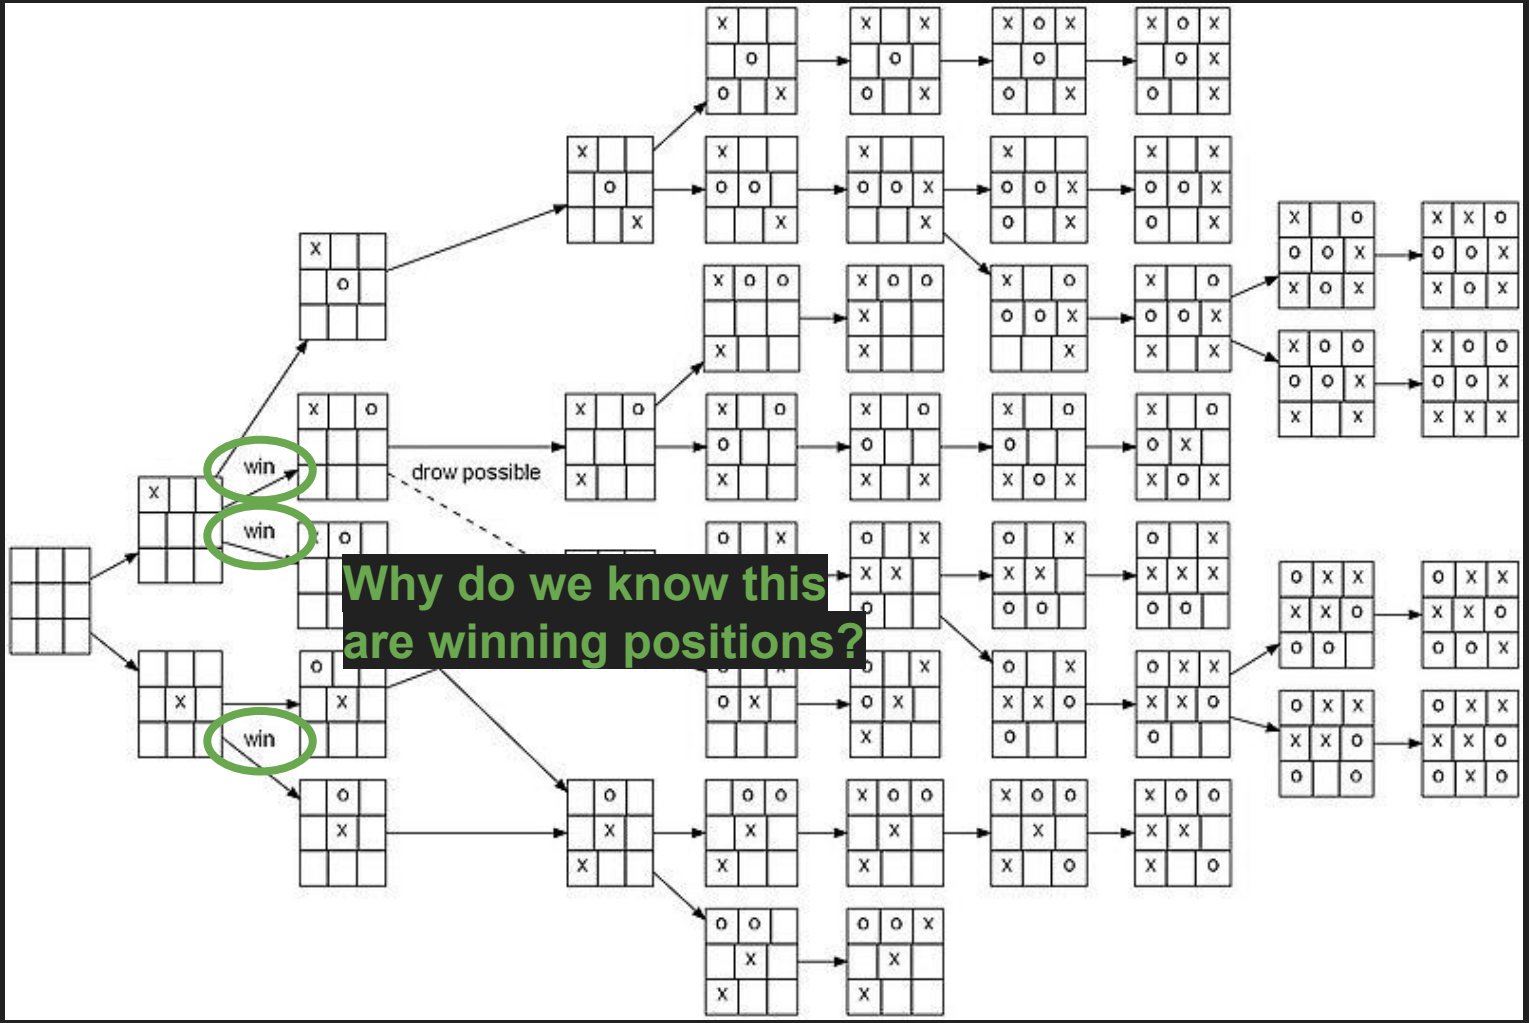
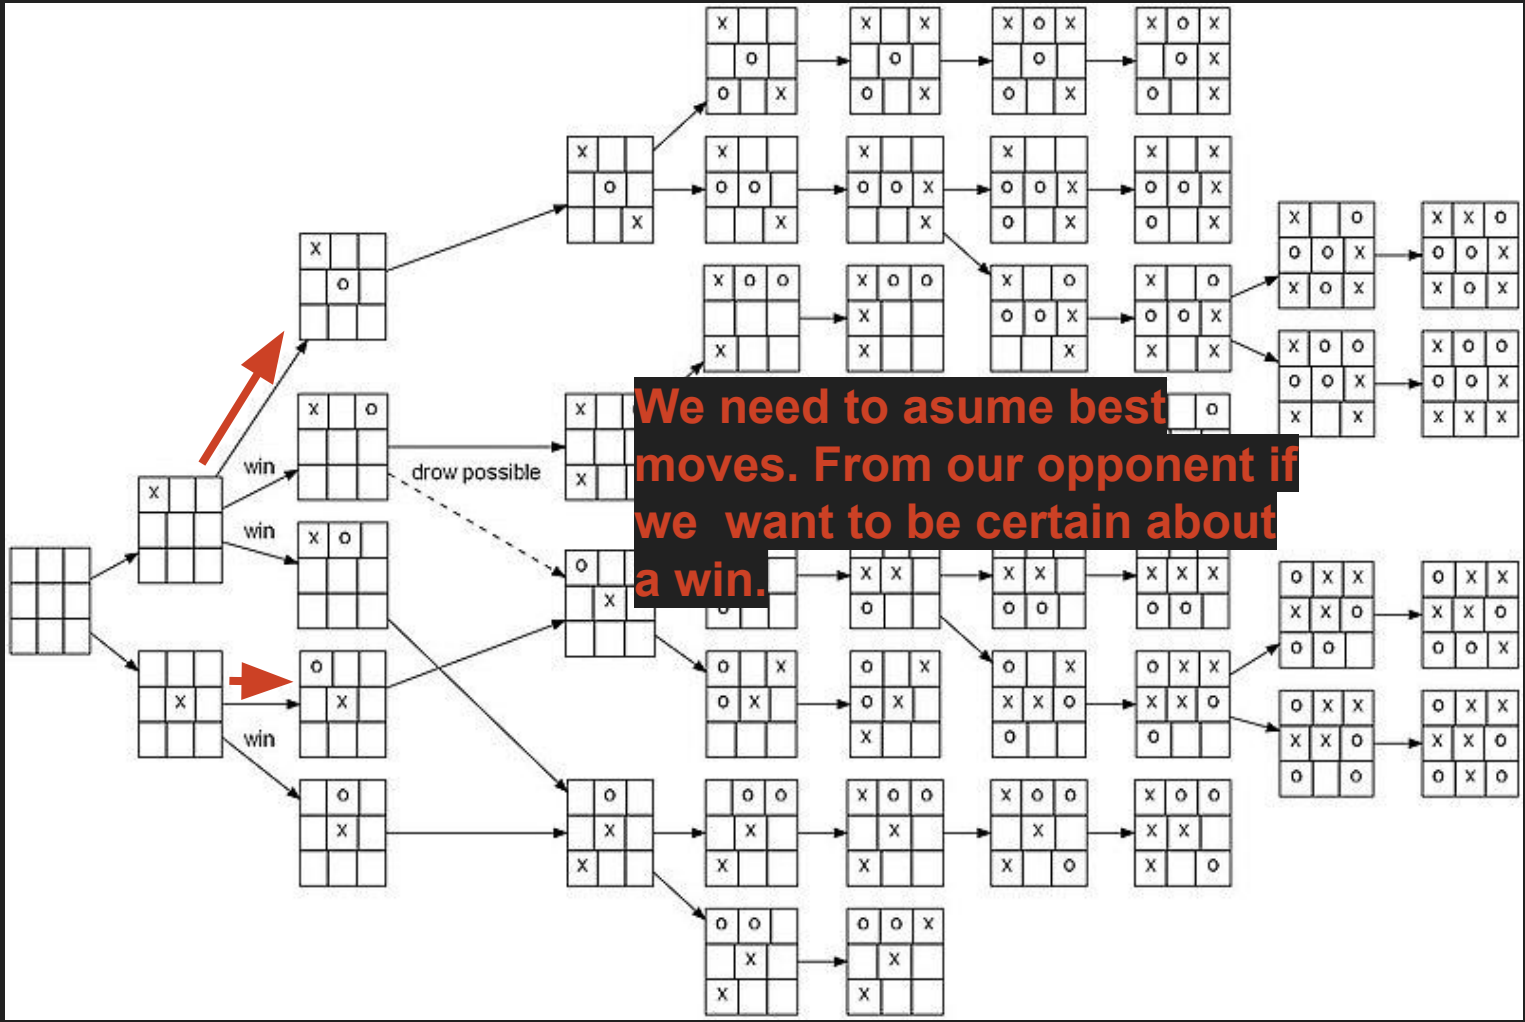
How do we build “Intelligent” systems?



win
win
win
drow possible



Why do we know this are winning positions?

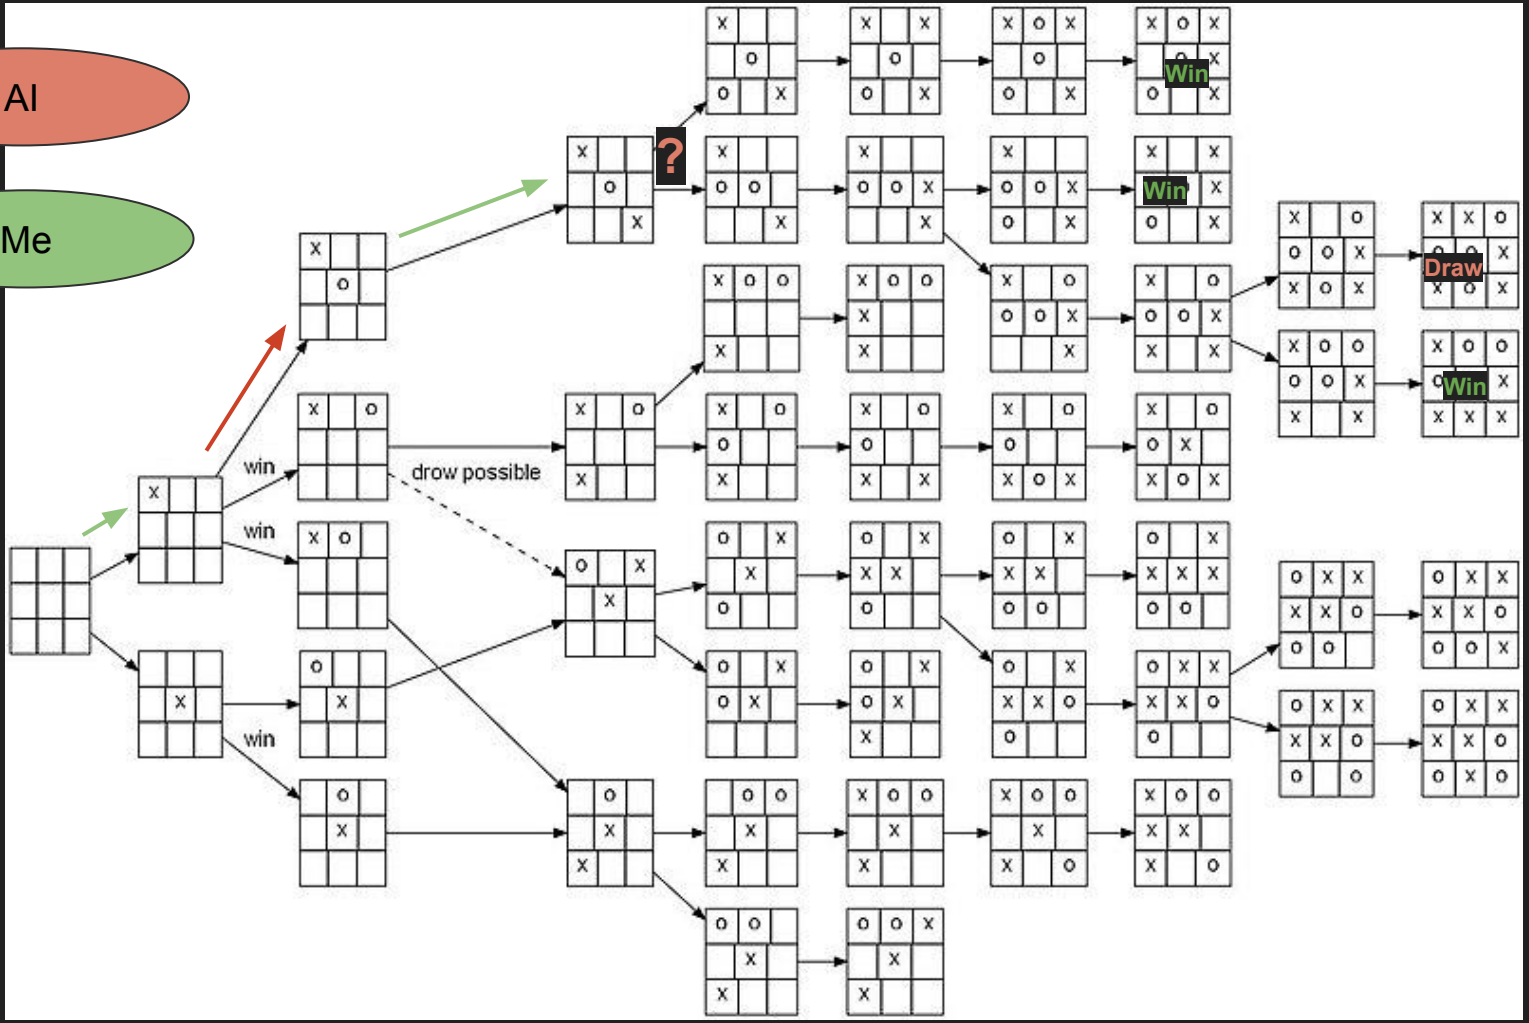


We need to asume best moves. From our opponent if we want to be certain about a win.

Let’s simulate a game!

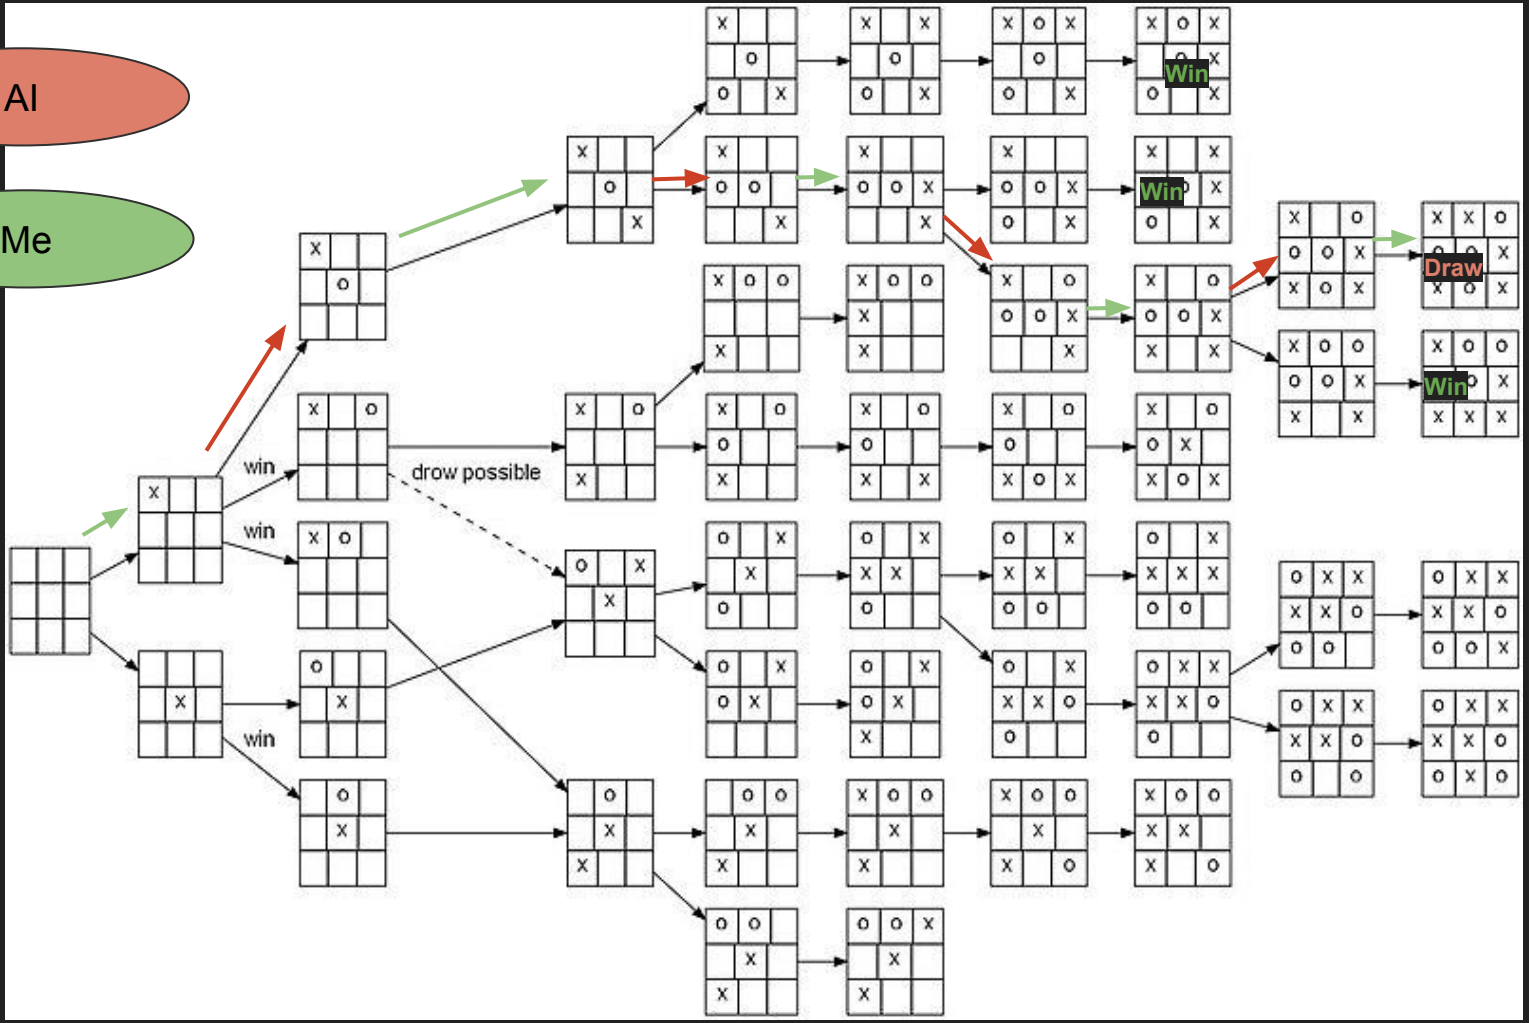
AI

Me



AI

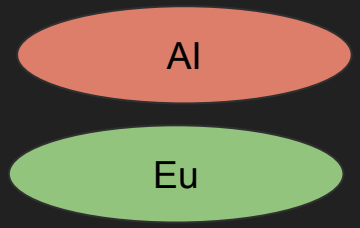
Me



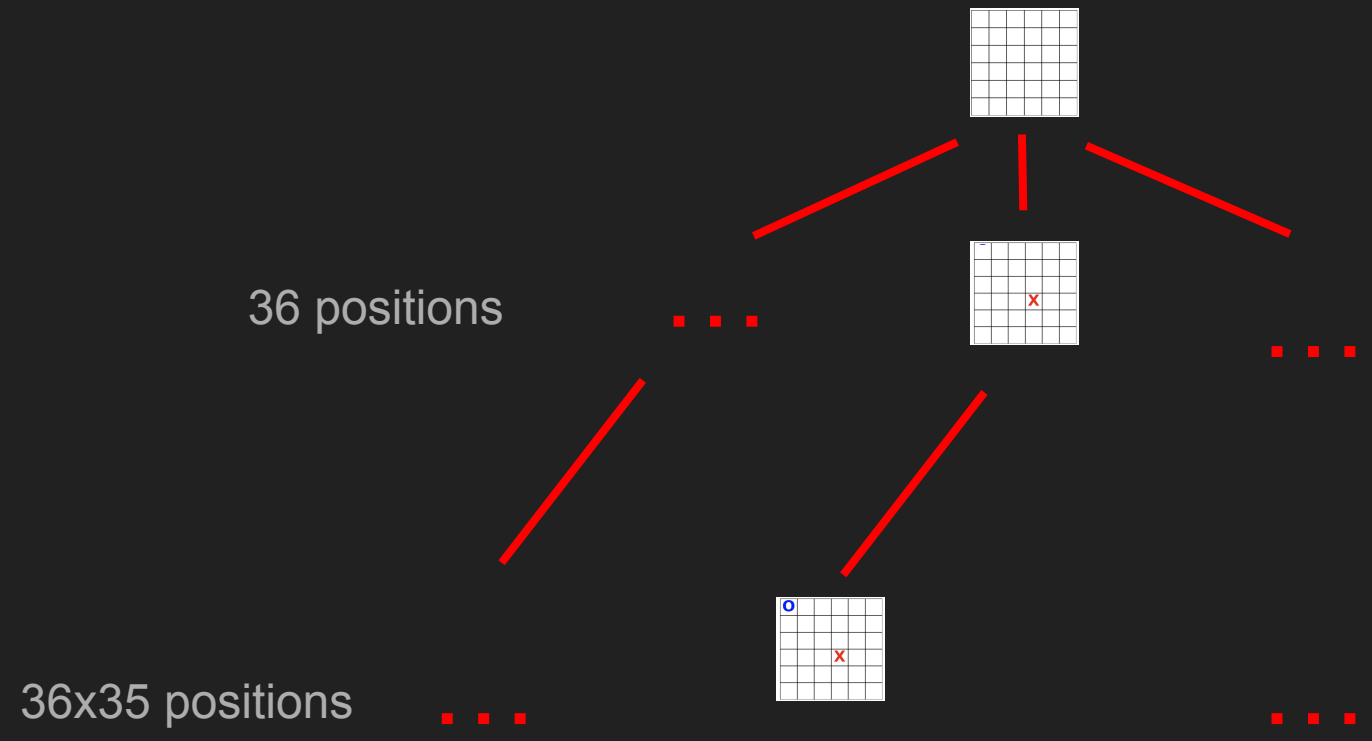
Observations:

1. What happens if we can't see until the end of the game?

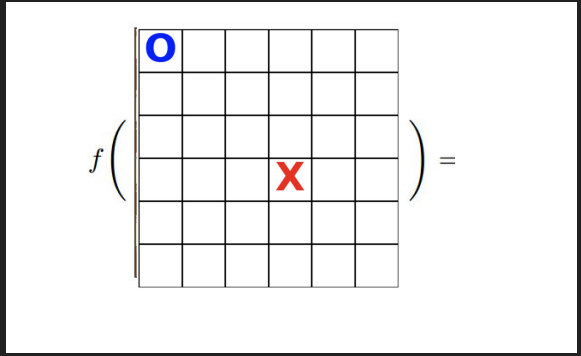
2. Mini-Max Algorithm

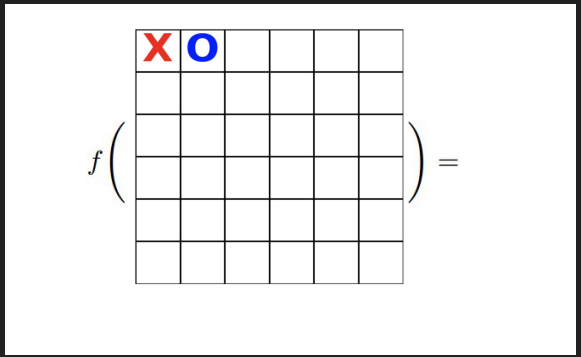


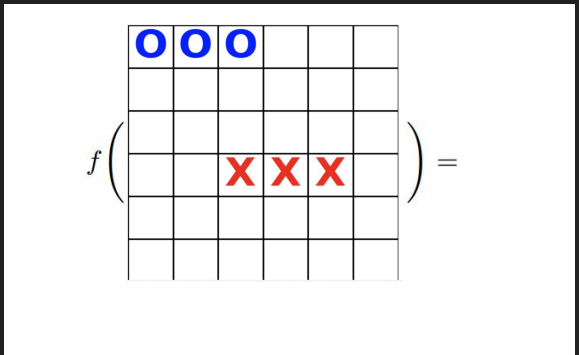
Number of positions on a 6 by 6 board.



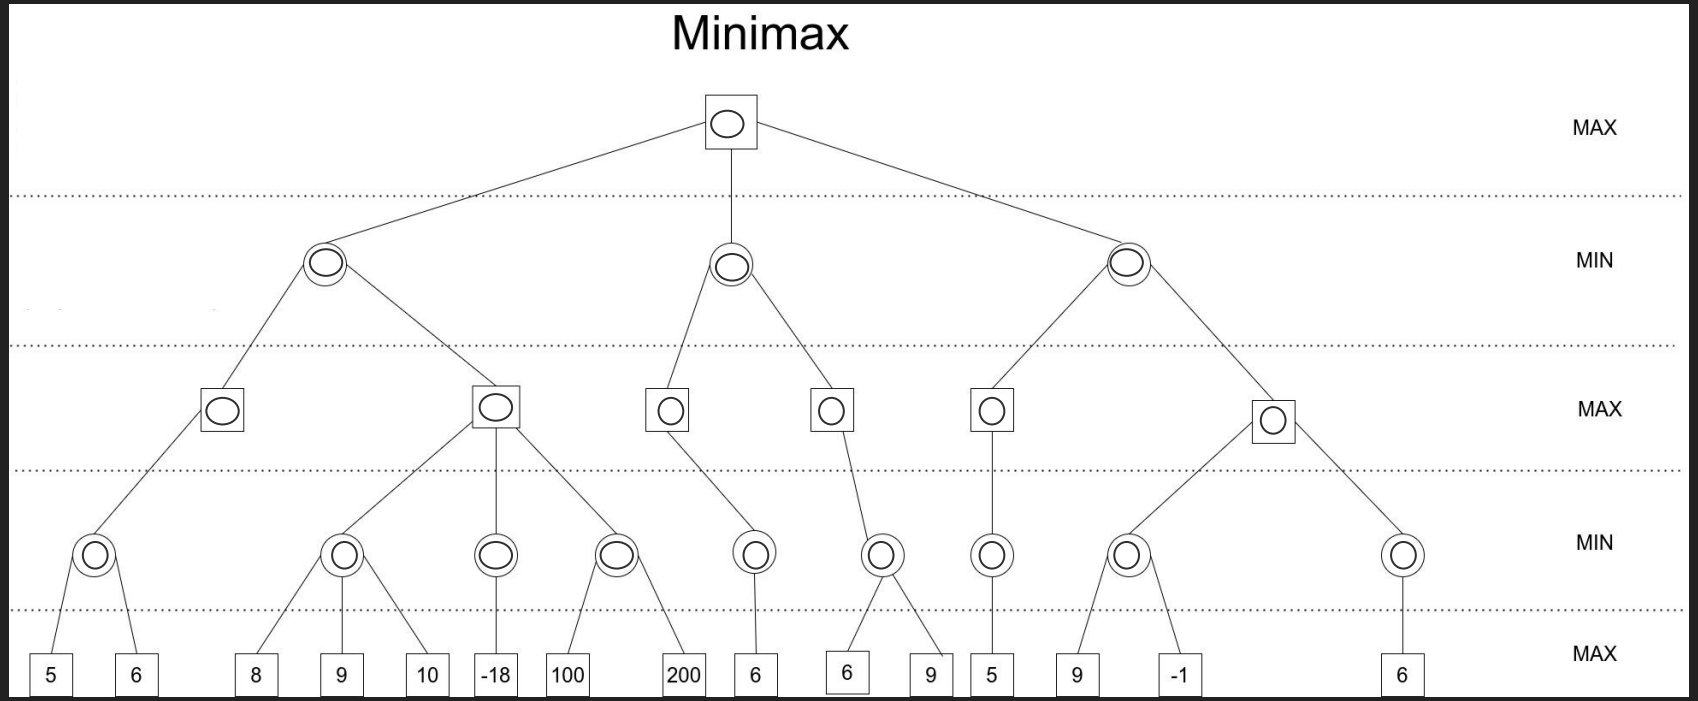
How can we evaluate and help AI make better decisions if we cannot see the end of the game?



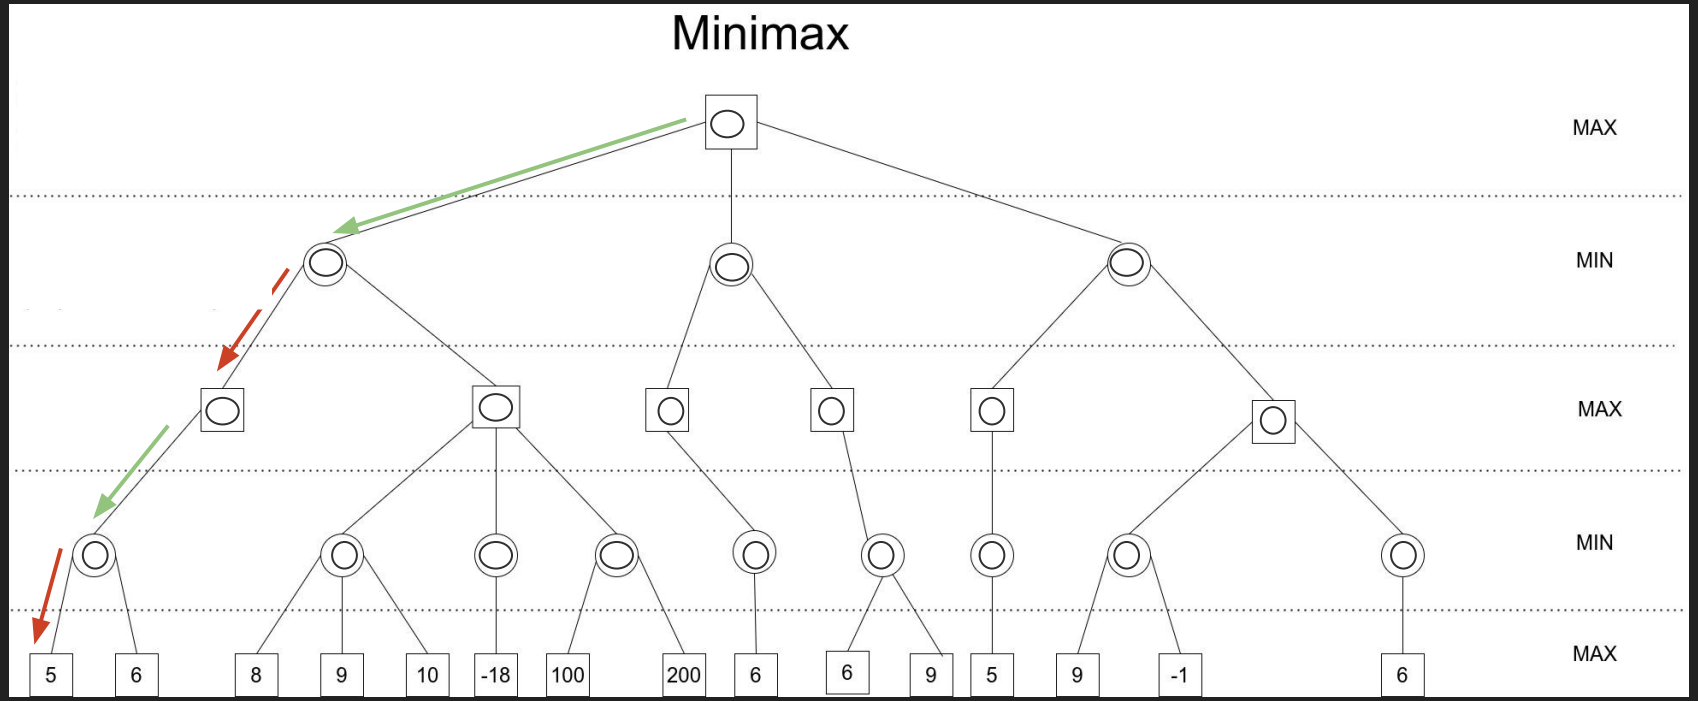




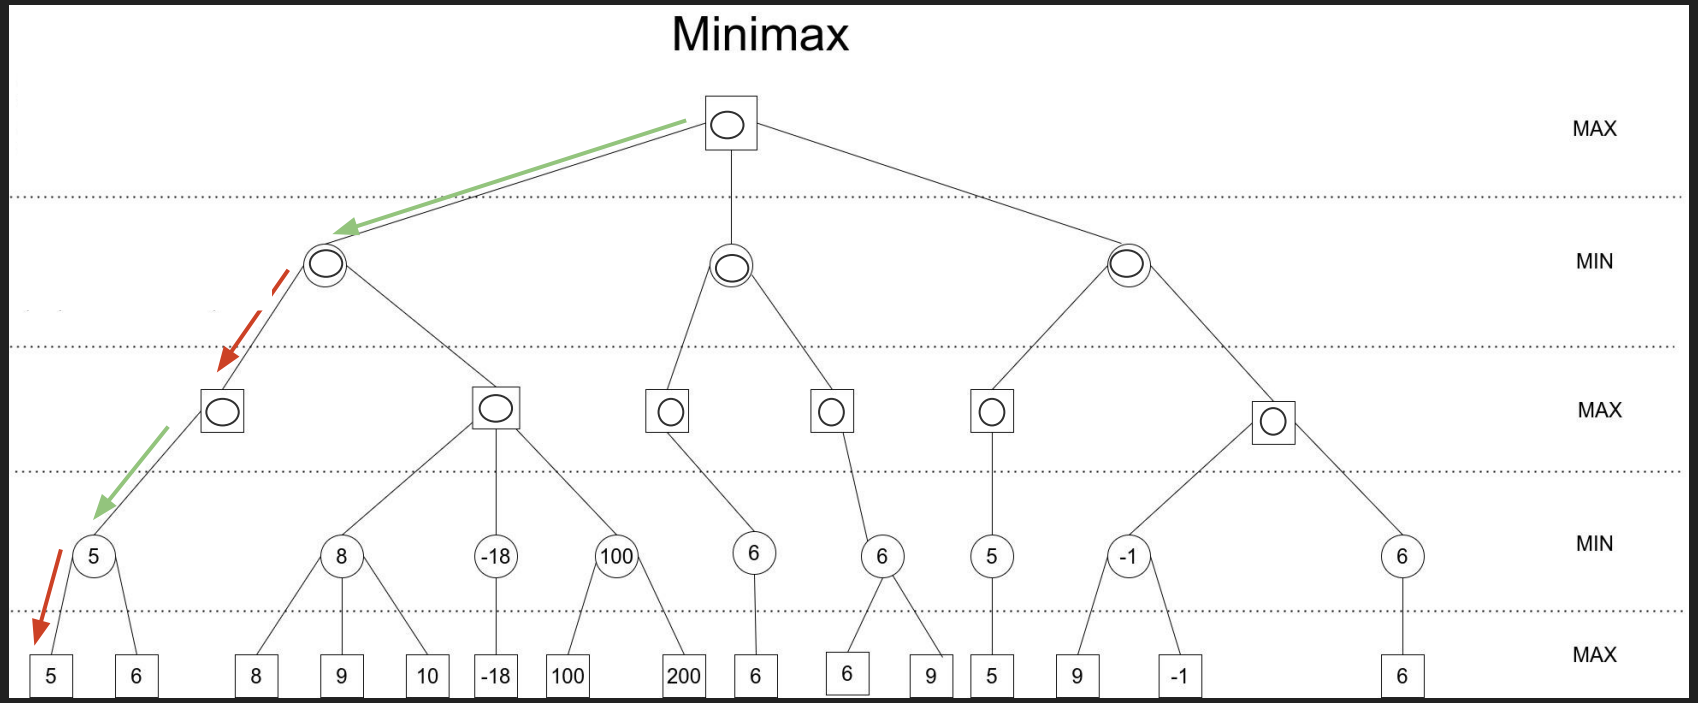
MiniMax Algorithm



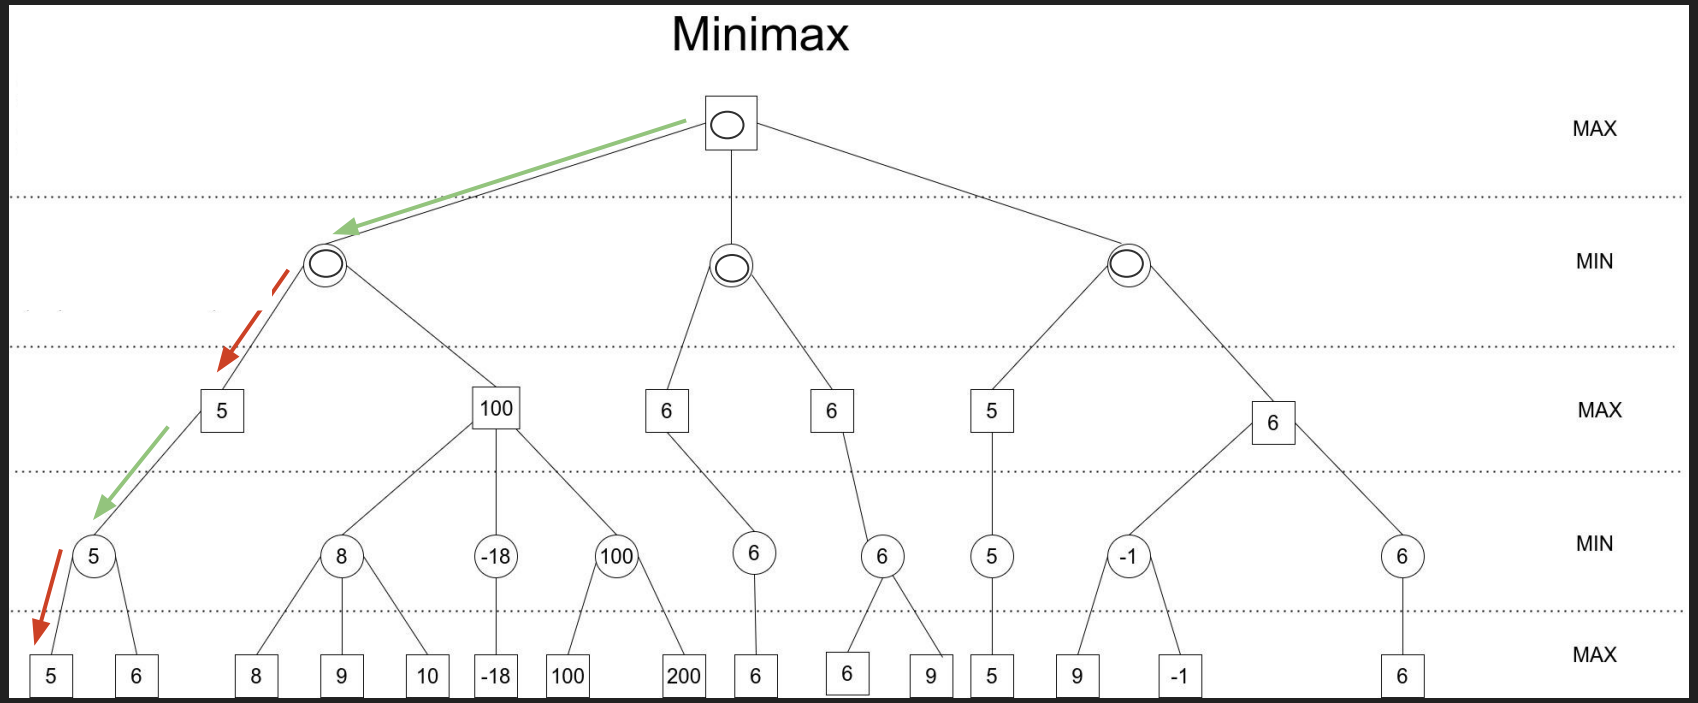
MiniMax Algorithm



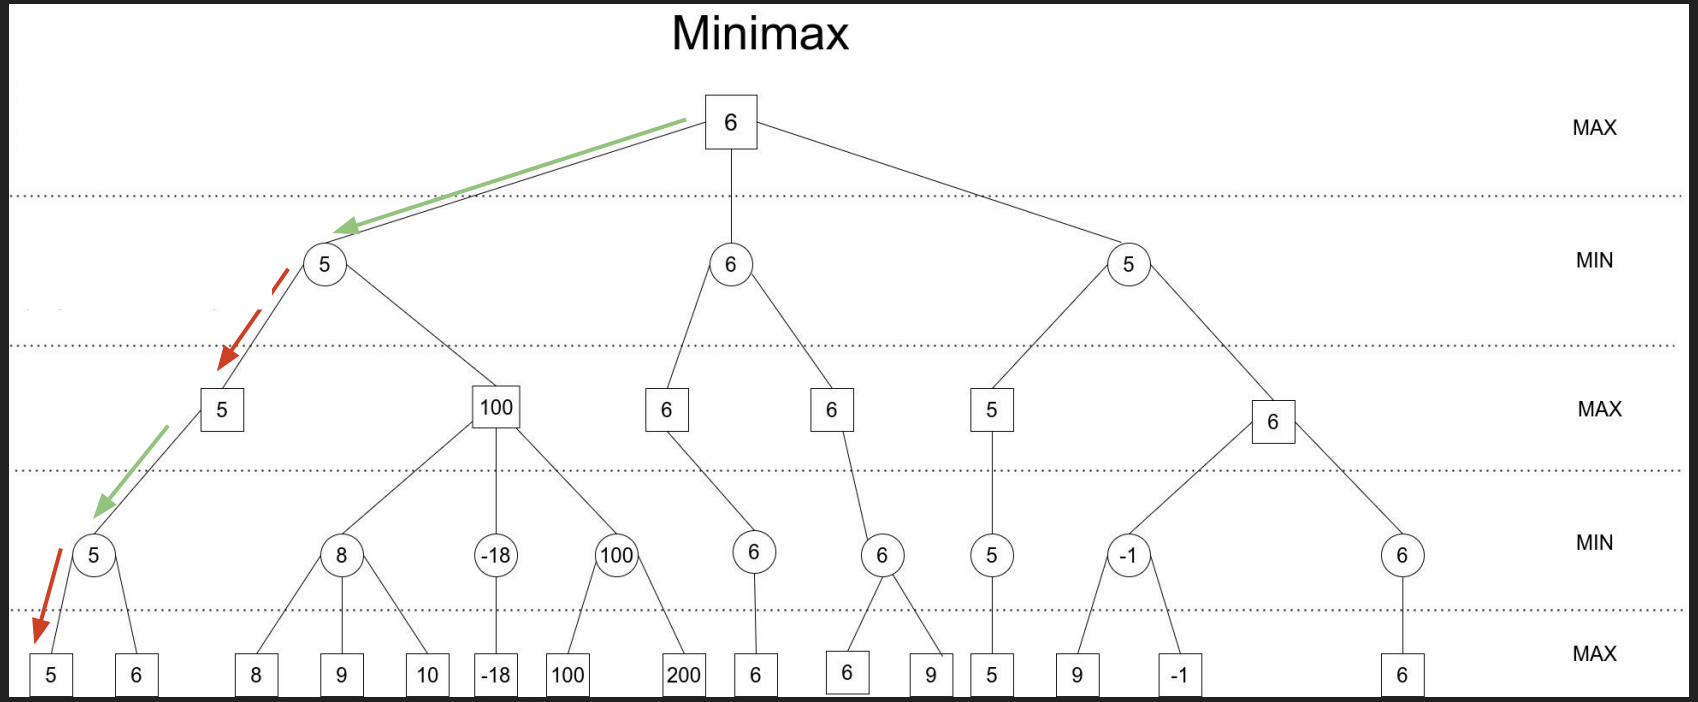
MiniMax Algorithm



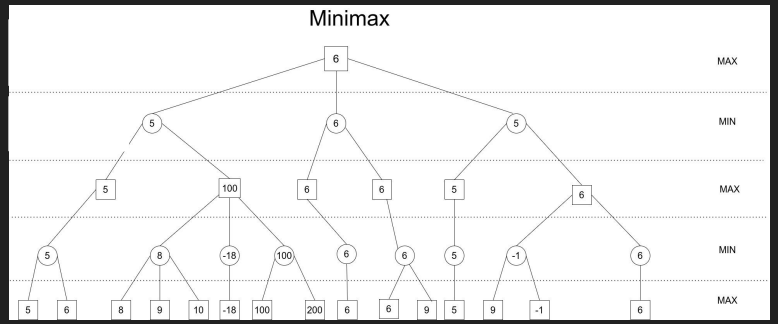
MiniMax Algorithm



MiniMax Algorithm



MiniMax Algorithm



```
Minimax(node, depth, is_maximizing_player)
    IF depth > 3 OR node is terminal
        RETURN the heuristic value of node

    IF is_maximizing_player
        best_value = -∞
        FOR each child of node
            value = Minimax(child, depth + 1, FALSE)
            best_value = max(best_value, value)
        RETURN best_value

    ELSE
        best_value = ∞
        FOR each child of node
            value = Minimax(child, depth + 1, TRUE)
            best_value = min(best_value, value)
        RETURN best_value
```

What did we learn today?
